

HOW WE RAN PROJECT AIR WITH AI FROM DAY ONE

CLAUDE CODE AS **CREATIVE** COMMAND CENTER

A “Brand Brain” for the whole project, online from day one.

MCP integrations

6

project phases

JUN 9

AI Day 2026

02

Git hub

A “Brand Brain” at the center

THE SETUP

- GitHub repo as the [single source of truth](#): every doc, decision, and brief
- CLAUDE.md loaded at session start: instant orientation, no ramp-up
- Decision logs on every creative turn: settled questions stay settled

THE INTEGRATIONS

- Google Calendar: six meetings from one prompt
- Google Drive: asset folders and headshots
- Figma: read and write to the design library
- Slack: every status update and reveal
- Webhooks: repo events notify the team

Context

One place that holds what the project is, so any session starts informed.

Connections

Live tools wired in, so data is reachable without copy-paste.

Capabilities

A short phrase kicks off a multi-step job that ships real work.

Cadence

Parts of it run on their own and keep delivering.

03

Make AI feel like a **festival**, not a tech conference

- Event: AI Day, June 9, 2026, about 830 employees across 5 global locations
- Vibe: SXSW meets Coachella. Warm, bold, festival energy, not a tech conference
- Five deliverables: animated logo, 24 speaker posters, PPT template, hats and wristbands, tiered swag
- Creative team: a six-person crew, creative direction, design, copy, and production
- Hard deadline: June 9, 2026, set by the program brief

04

The **repo** was the project

Git hub

- Every document lived in GitHub: brief, phases, decisions, agendas, vendor specs
- Claude read any file by raw URL: context from live source, never stale copies
- Branching: main is approved, draft is in progress, review is ready for feedback
- Decision logs captured every direction change, with the rationale preserved
- CLAUDE.md at workspace and project level: full context in seconds at every start

05

Six team meetings created in one prompt

- Connected Google Calendar MCP to Claude Code: calendar write access from the terminal
- All six project meetings from a single prompt: Meet links, attendees, and descriptions included
- Pre-work notes, repo links, and agenda context embedded in each invite automatically
- Zero copy-pasting or manual entry: invites sent with one confirmation

“The whole thing takes about 2 minutes once the repo is set up.”

`docs/google-calendar-setup.md`

06

Asset collection, **hands-free**

Google Drive

- Connected Google Drive MCP with direct folder read and write from Claude
- Headshot submissions for 21 ambassadors and executives, organized by poster slot
- Claude checked folder contents and flagged missing submissions without leaving the terminal
- Vendor assets, swag reference files, and brand exports all routed through Drive

21

headshot submissions
ambassadors + executives

07

Design files, **readable by AI**

Figma

- Connected Figma MCP with Editor access: read and write, no viewer limits
- Claude inspected the component library and read color tokens and type styles directly
- Verified logo production files: SVG, PDF, PNG @2x, WEBP @0.5x, AI source
- Audited the library against brand guidelines and flagged inconsistencies in real time

08

Claude

Claude as the team's **writer**

- Claude drafted all Slack communications: status updates, check-ins, headshot guide rails
- Poster reveal announcements formatted for internal channels, ready to send
- “Ready to test” summaries after every change: what changed, how to verify, what to expect
- “Created with AI” dashboard updates posted to the project channel after each milestone
- Pattern: Claude drafts, Michael sends. The team always sees a human hand on the button

09

Automated status on **every push**

- Webhooks on the GitHub repo triggered Slack notifications on key events
- Phase completions, logo approval, and vendor deadline updates auto-surfaced to the team
- Atlas print deadline conflict (May 22 vs. May 25) flagged automatically when dates changed
- No manual check-in messages needed: the system surfaced the update

Conflict detection: the webhook fired when the Atlas deadline was edited. The team saw it before anyone had to say anything.

10

Showing our work, **live**

- Brief commitment: “This conference is brought to you by AI. The creative should be too.”
- The dashboard tracked every deliverable that used AI: the tool, its role, and the output
- Tools logged: Claude Code, Adobe Firefly, ElevenLabs, Gemini, Figma AI
- AI Photo Booth and AI Song documented as AI-first attendee experiences built for the event
- Not just a tracker, a proof point: the dashboard is the story told on AI Day

11

AI wasn't a feature. It was the **workflow**

Slack updates?
The Project Air
Tracker maybe

CREATIVE WORK

- Logo ideation: references and concept directions explored with AI
- Brand guidelines: written and updated live in the repo, readable any time
- Vendor comparisons: Superside vs. in-house, Atlas vs. alternatives, analyzed by Claude

PRODUCTION WORK

- Meeting summaries: May 18 session notes consolidated by Gemini
- Poster system: slot architecture designed with Claude code-gen
- Copy: 20 prompt-card ideas generated by AI pre-meeting
- This presentation: generated in PptxGenJS by Claude Code

Six phases, **one AI thread** running through all of them

01

Brand Foundation

May 5 – 9

02

Templates & Systems

May 14

03

Production Sprint

May 22

04

Animation & Polish

May 27

05

Print Handoff

Jun 2

06

Premium Swag

Jun 6

KEY CONDITIONS

—
THE “BRAND BRAIN” LAYERS

13

The conditions that made AI-first possible

- Context: everything in the repo, readable by Claude at any raw GitHub URL
- Connections: Calendar, Drive, and Figma wired in, so Claude reached tools, not just files
- Capabilities: a short prompt kicked off multi-step jobs that shipped real artifacts
- Cadence: webhooks and the dashboard kept delivering with no one watching
- Trust and iteration: the team redirected and Claude revised. A collaborator, not a vending machine

This is either redundant from what we're showing in slide that is 02 or where the 4 Cs should be instead.

Lessons from a **creative sprint** with AI

KEEP

- CLAUDE.md session-start context at workspace and project level
- Repo-as-source-of-truth with raw GitHub URLs for instant access
- MCP connections to Calendar and Drive set up before the project starts
- Decision logs for every major turn: context that accumulates

ADD NEXT TIME

- Slack MCP connected from day one, not mid-project
- Webhook setup in the first week, not after phase 2
- Dashboard structure defined before production begins
- Figma MCP set up before the component library is built

15

Everything orbits **one repo**

“

This conference is brought to you by AI.
The creative should be too.

We didn't just talk about AI adoption. We ran the project with it.

PROJECT AIR • AI IN REACH • THE WEATHER COMPANY

Workflow: [docs/claude-workflow.md](#)
